Urban Design 1

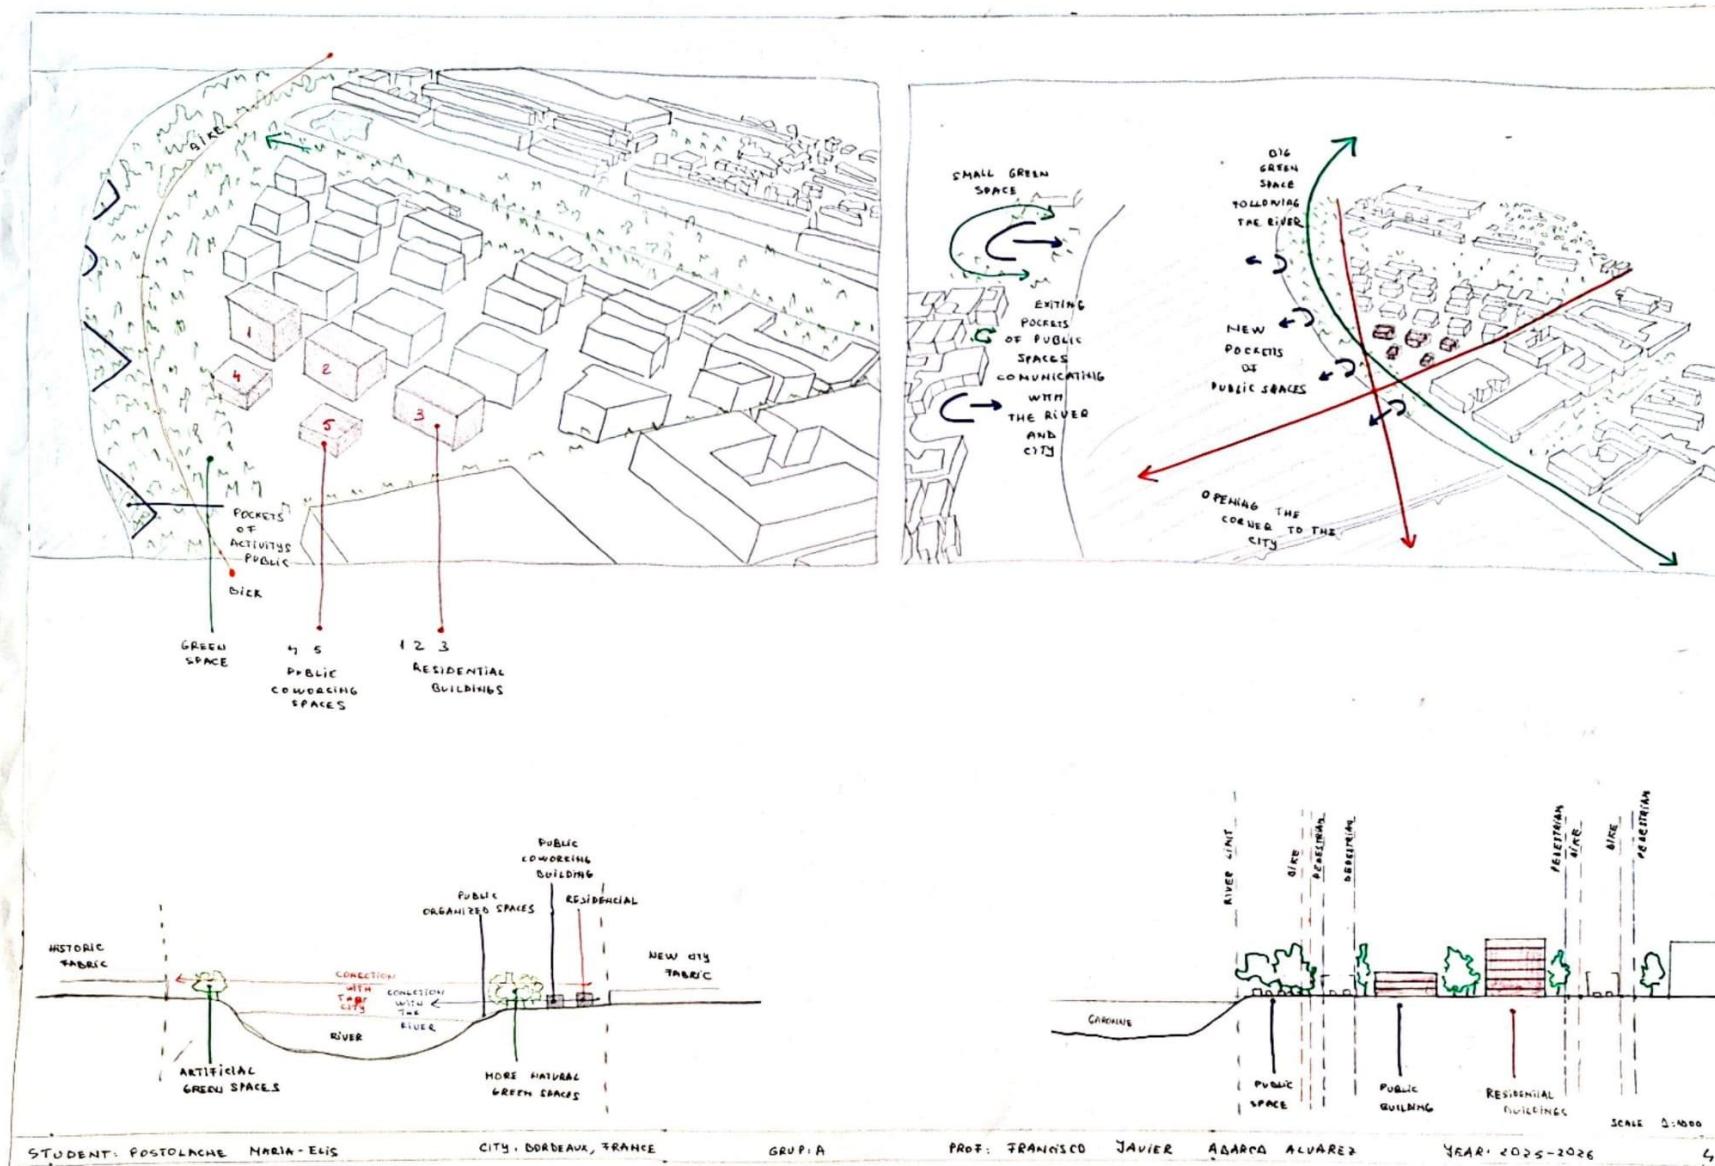

Strategy for development Bodeaux, France

Postolache Maria-Elis Grup A Prof. Abarca Francisco

My project aims to introduce the team's shared strategy of improving the quality of green spaces in the city of Bordeaux. After analyzing the areas where such a solution could be implemented, the less developed and more natural right bank emerged as the most suitable choice. Positioned with a corner oriented toward the central area and opening toward key urban nodes, the site allows for the emergence of a new urban intervention.

Thus, the proposal creates new public pockets that act as platforms for social activities within a controlled yet natural green environment, directly connected to both banks of the river and to the river itself. Everythn tied by a bikening and pedestrian riben across the river making things accesibal.

The newly introduced spaces include three residential buildings with a ground floor plus five upper levels (G+5), two public buildings with functions that support a wide range of social activities, and a riverbank area featuring outdoor gyms, children's playgrounds, a skate park, an amphitheater with a small stage oriented toward the water, and many other public amenities.
